    int mid = (l + r) >> 1;
    update(id << 1, l, mid, u, v, x);
    update(id << 1 | 1, mid + 1, r, u, v, x);

    st[id] = merge(st[id << 1], st[id << 1 | 1]);
}

int get(int id, int l, int r, int u, int v){
    if (r < u || v < l) return -INF;
    if (u <= l && r <= v) return st[id];

    down(id, l, r);

    int mid = (l + r) >> 1;
    return merge(get(id << 1, l, mid, u, v), get(id
        << 1 | 1, mid + 1, r, u, v));
}
} ST;
```

### Fenwick Tree

```
void update(int i, int val){
    for (; i <= n; i += i & -i) bit[i] += val;
}

int get(int i){
    int res = 0;
    for (; i; i -= i & -i) res += bit[i];
    return res;
}
```

### Sigma Tree

```
struct Sigma_Tree{
    int st[2 * N];

    void init(){
        For(i, 1, n) st[i + n - 1] = a[i];
        ForD(i, n - 1, 1) st[i] = merge(st[i << 1],
            st[i << 1 | 1]);
    }

    void update(int p, int val){
        p += n - 1;
        st[p] = val;
        for (; p > 1; p >>= 1) st[p >> 1] = merge(st[p],
            st[p ^ 1]);
    }

    int get(int l, int r){
        int res = 0;
        for (l += n - 1, r += n - 1; l <= r; l >>= 1,
            r >>= 1){
            if (l & 1) res = merge(res, st[l++]);
            if (!(r & 1)) res = merge(res, st[r--]);
        }
        return res;
    }
} ST;
```

### Segment Tree

```
struct Segment_tree{
    int st[4 * N], lazy[4 * N];

    void apply(int id, int c){
        update(st[id], c);
        update(lazy[id], c);
    }

    void down(int id, int l, int r){
        int c = lazy[id]; lazy[id] = 0;
        apply(id << 1, c); apply (id << 1 | 1, c);
    }

    void build(int id, int l, int r){
        if (l == r){
            st[id] = a[l];
            return;
        }

        int mid = (l + r) >> 1;

        build(id << 1 | 1, mid + 1, r);

        st[id] = merge(st[id << 1], st[id << 1 | 1]);
    }
}
```

### Persistent Segment Tree

```
struct Node {
    int left, right; // ID of left child & right
        child
    long long ln; // Max value of node
    Node() {}
    Node(long long ln, int left, int right) : ln(ln),
        left(left), right(right) {}
}
```

```

} it[N]; // Each node has a position in this array,
        called ID
int nNode;

int ver[N]; // ID of root in each version

// Update max value of a node
inline void refine(int cur) {
    it[cur].ln = max(it[it[cur].left].ln, it[it[cur].
        right].ln);
}

// Update a range, and return new ID of node
int update(int l, int r, int u, int x, int oldId) {
    if (l == r) {
        ++nNode;
        it[nNode] = Node(x, 0, 0);
        return nNode;
    }

    int mid = (l + r) >> 1;
    int cur = ++nNode;

    if (u <= mid) {
        it[cur].left = update(l, mid, u, x, it[oldId]
            .left);
        it[cur].right = it[oldId].right;
        refine(cur);
    }
    else {
        it[cur].left = it[oldId].left;
        it[cur].right = update(mid+1, r, u, x, it[
            oldId].right);
        refine(cur);
    }

    return cur;
}

// Get max of range. Same as usual IT
int get(int nodeId, int l, int r, int u, int v) {
    if (v < l || r < u) return -1;
    if (u <= l && r <= v) return it[nodeId].ln;

    int mid = (l + r) >> 1;
    return max(get(it[nodeId].left, l, mid, u, v),
        get(it[nodeId].right, mid+1, r, u, v));
}

// When update:
++nVer;
ver[nVer] = update(1, n, u, x, ver[nVer-1]);

// When query:
res = get(ver[t], 1, n, u, v);

```

## Hash Map

```

//faster than unordered_map
struct hash_map {
    const static int SZ = 2e4 + 9;
    int nxt[SZ >> 3], val[SZ >> 3];
    int key[SZ >> 3];
    int h[SZ + 5], cnt;
    vector<int>vec;

    void clear(){
        for (int i : vec) h[i] = 0;
    }

```

```

        for (int i = 1; i <= cnt; i++)
            val[i] = nxt[i] = 0, key[i] = 0;

        vec.clear();
        cnt = 0;
    }

    int hash(int u) {
        return u % SZ;
    }

    int &operator[](int u) {
        int x = hash(u);

        for (int i = h[x]; i; i = nxt[i])
            if (key[i] == u) return val[i];

        if (!h[x]) vec.push_back(x);

        ++cnt;
        key[cnt] = u;
        val[cnt] = 0;
        nxt[cnt] = h[x];
        h[x] = cnt;
        return val[cnt];
    }

    int qry(int u) {
        int x = hash(u);
        for (int i = h[x]; i; i = nxt[i])
            if (key[i] == u) return val[i];

        return 0;
    }
} hs;

```

## Parallel Binary Search

```

while (1){
    bool ok = 1;

    For(i, 1, q){
        if (l[i] > r[i]) continue;
        ok = 1;
        queries[(l[i] + r[i]) >> 1].push_back(i);
    }

    reset();
    For(t, 1, n){
        //update(t,...);
        for (int i: queries[t]){
            if (check(i)) r[i] = t - 1;
            else l[i] = t + 1;
        }
    }
}

```

## Ternary Search

Find the maximum Point in a Graph like:  $\wedge$

```

double max_f(double left, double right) {
    int N_ITER = 100;
    for (int i = 0; i < N_ITER; i++) {
        double x1 = left + (right - left) / 3.0;
        double x2 = right - (right - left) / 3.0;
        if (f(x1) > f(x2)) right = x2;
        else left = x1;
    }
}

```

```
    return f(left);
}
```

## String

### Trie 1

```
struct node{
    node *g[26];
    node(){
        rep(i, 26) g[i] = NULL;
    }
} *root = new node();

void Insert(string s){
    node *p = root;
    for (char t: s){
        if (p->g[t - 'a'] == NULL)
            p->g[t - 'a'] = new node();

        p = p->g[t - 'a'];
    }
}
```

### Trie 2

```
int nNode = 0;
int g[N][26];

void Insert(string s){
    int p = 0;
    for (char t: s){
        if (!g[p][t - 'a']) g[p][t - 'a'] = ++nNode;
        p = g[p][t - 'a'];
    }
}
```

## Hash

```
ll getHashT(int i, int j) {
    return (hashT[j] - mul(hashT[i - 1], POW[j - i + 1]) + MOD) % MOD;
}

// Precalculate base^i
for (int i = 1; i <= lenT; i++)
    POW[i] = (POW[i - 1] * base) % MOD;

// Calculate hash value of T[1..i]
for (int i = 1; i <= lenT; i++)
    hashT[i] = (hashT[i - 1] * base + (T[i] - 'a' + 1)) % MOD;
```

## KMP

```
//prefix function: length of the longest prefix of
//the substring s[1..i] that is also a suffix of
//this same substring
int k = 0;
for(i, 2, n){ //1-indexed
    while (k && s[k + 1] != s[i]) k = kmp[k];
    kmp[i] = (s[k + 1] == s[i]) ? ++k : 0;
}
```

## Manacher

```
vector<int> manacher_odd(string s) {
    int n = s.size();
```

```
    s = "$" + s + "~";
    vector<int> p(n + 2);
    int l = 0, r = 1;
    for(int i = 1; i <= n; i++) {
        p[i] = min(r - i, p[l + (r - i)]);
        while(s[i - p[i]] == s[i + p[i]]) {
            p[i]++;
        }
        if(i + p[i] > r) {
            l = i - p[i], r = i + p[i];
        }
    }
    return vector<int>(begin(p) + 1, end(p) - 1);
}

vector<int> manacher(string s) {
    string t;
    for(auto c: s) {
        t += string("#") + c;
    }
    auto res = manacher_odd(t + "#");
    return vector<int>(begin(res) + 1, end(res) - 1);
}
```

## Aho - Corasick

```
namespace Trie{
    struct Node{
        int child[26], p = -1, cnt = 0;
        char pch;
        int link = -1, go[26];
        Node(int p = -1, char ch = '#'): p(p), pch(ch){
            fill(begin(child), end(child), -1);
            fill(begin(go), end(go), -1);
        }
    };

    vector<Node> g(1);

    void add(string s){
        int v = 0;
        for (char t: s){
            int c = t - 'a';
            if (g[v].child[c] == -1){

                g.emplace_back(v, t);
            }
            v = g[v].child[c];
        }
        g[v].cnt++;
    }

    int go(int v, char c);

    int get_link(int v){
        if (g[v].link == -1){
            if (!v || !g[v].p) g[v].link = 0;
            else g[v].link = go(get_link(g[v].p), g[v].pch);
        }
        return g[v].link;
    }

    int go(int v, char t){
        int c = t - 'a';
        if (g[v].go[c] == -1){
            if (g[v].child[c] != -1) g[v].go[c] = g[v].
                child[c];
```

```

        else g[v].go[c] = (v == 0) ? 0 : go(get_link(v)
            , t);
    }
    return g[v].go[c];
}
}

```

## Aho - Corasick (BFS)

```

struct trie{
    struct Node{
        Node *child[26], *link;
        int cnt = 0;
        Node(){
            cnt = 0;
            rep(i, 26) child[i] = NULL;
            link = NULL;
        }
    } *root = new Node();

    void add(string &s){
        Node* p = root;
        for (char &t: s){
            int c = t - 'a';
            if (p->child[c] == NULL) p->child[c] = new Node
                ();
            p = p->child[c];
        }
        p->cnt++;
    }

    void AhoCorasick(){
        root->link = root;
        queue<Node*> q; q.push(root);
        while (!q.empty()){
            Node* p = q.front(); q.pop();
            rep(i, 26) if (p->child[i]){
                Node* k = p->link;
                while (k != root && k->child[i] == NULL) k =
                    k->link;

    }
    if (!sml) dp[id][...] = res;
    return res;
}

int get(int x){
    int n = 0;
    while (x){
        a[n++] = x % 10;
        x /= 10;
    }
    return f(n - 1, 1, ...);
}

```

## SOS DP

```

for (int k = 0; k < n; k++)
    for (int mask = 0; mask < (1 << n); mask++)
        if (mask & (1 << k))
            dp[mask] += dp[mask ^ (1 << k)];

```

## DP DNC

Solving problems that have the form:

$$dp(i, j) = \min_{0 \leq k \leq j} (dp(i-1, k-1) + C(k, j))$$

The cost function has to satisfy the quadrangle inequality:  $C(a, c) + C(b, d) \leq C(a, d) + C(b, c)$  for all  $a \leq b \leq c \leq d$ .

Example:

$C(j, i) = f(i - j)$  where  $f$  is convex.

$C(j, i) = (i - j)$

$C(j, i) = (i - j)^2$

```

int m, n;
vector<int> dp_before(n + 1), dp_cur(n + 1);

// cost function
int C(int l, int r);

// calculate dp_cur[l], ..., dp_cur[r]
void compute(int l, int r, int optl, int optr) {
    if (l > r) return;

    int mid = (l + r) >> 1;
    pair<int, int> best = {INT_MAX, -1};
    //calculate dp_cur[mid] & opt[i][mid] depend on
    dp_before and cost func
    for (int k = optl; k <= min(mid, optr); ++k) {
        minimize(best, {dp_before[k] + C(k, mid), k});
    }
    dp_cur[mid] = best.first;
    int opt = best.second;

    compute(l, mid - 1, optl, opt);
    compute(mid + 1, r, opt, optr);
}

```

```

}

int solve() {
    for (int i = 0; i <= n; ++i)
        dp_before[i] = C(0, i);

    for (int i = 1; i < m; ++i) {
        compute(0, n, 0, n);
        dp_before = dp_cur;
    }

    return dp_before[n];
}

```

## Convex Hull Trick

Adding lines  $y = kx + m$  and querying minimum values at integer  $x$ .

```

struct Line {
    int k, m;
    mutable int p;

    int eval(int x){
        return k * x + m;

            }
        }
    }
}
```

## Knapsack on Tree

Problem: Given a tree  $T$  with  $N$  vertices rooted at vertex 1 ( $1 \leq N \leq 5000$ ). The  $i$ -th vertex has a value

$C_i$  and a constraint  $K_i$  ( $|C_i| \leq 10^9$ ,  $1 \leq K_i \leq N$ ). Choose a subset of vertices such that, in the subtree of every vertex  $i$ , there are at most  $K_i$  chosen vertices, and the total sum of the chosen vertices' values is maximized.

```
void calc(int V){
    int n = child[V].size();

    for(int v_i: child[V]) {
        calc(v_i);
    }

    for(int i = 0; i <= n; i++) fill(fV[i], fV[i] + N + 1, -INF);
    fV[0][0] = 0;

    for(int i = 1; i <= n; i++){
        int v_i = child[V][i - 1];
        for(int a = 0; a <= sz[V]; a++){
            for(int b = 0; b <= sz[v_i]; b++){
                fV[i][a+b] = max(fV[i][a+b], fV[i-1][a] + dp[v_i][b]);
            }
            sz[V] += sz[v_i];
        }
    }

    for(int k = 0; k <= N; k++){
        if(k > K[V]) dp[V][k] = -INF;
        else {
            if(k > 0) dp[V][k] = max(fV[n][k], fV[n][k-1] + C[V]);
            else dp[V][k] = fV[n][k];
        }
    }
    sz[V]++;
}

long long solve() {
    calc(1);
    return *max_element(dp[1], dp[1] + N + 1);
}
```

## DP on Broken Profile

count the number of ways you can fill an  $n \times m$  grid using  $1 \times 2$  and  $2 \times 1$  tiles. ( $1 \leq n \leq 10, 1 \leq m \leq 1000$ )

```
dp[0][0] = 1;
for (int j = 0; j < m; j++)
    for (int i = 0; i < n; i++) {
        for (int mask = 0; mask < (1 << n); mask++) {
            dp[mask][1] = dp[mask ^ (1 << i)][0]; // Horizontal or no tile

            if (i && !(mask & (1 << i)) && !(mask & (1 << i - 1))) // Vertical tile
                dp[mask][1] += dp[mask ^ (1 << i - 1)][0];

            if (dp[mask][1] >= MOD) dp[mask][1] -= MOD;
        }
        for (int mask = 0; mask < (1 << n); mask++)
            dp[mask][0] = dp[mask][1];
    }
cout << dp[0][0] << '\n';
```

## Number Theory

### Euler's totient function

```
int phi(int n) {
    int res = n;
    for (int i = 2; i * i <= n; i++) {
        if (n % i == 0) {
            while (n % i == 0) n /= i;
            res -= res / i;
        }
    }
    if (n > 1) res -= res / n;
    return res;
}
```

### Euler's totient function from 1 to $N$

```
void preCompute(int n) {
    iota(phi, phi + N, 0); //phi[i] = i
    for (int i = 2; i <= n; i++) {
        if (phi[i] == i) {
            for (int j = i; j <= n; j += i)
                phi[j] -= phi[j] / i;
        }
    }
}
```

### Modular Inverse

```
//if MOD is a prime number then phi(MOD)= MOD - 1
int inv(int x, int MOD){
    return Pow(x, phi(MOD) - 1);
}
```

### Extended Euclidean Algorithm

```
//computing gcd(a, b) and finding (x, y) that
//ax + by = gcd(a, b)

//recursive version
int gcd(int a, int b, int& x, int& y) {
    if (b == 0) {
        x = 1; y = 0;

    for (ll i = 2; i * i <= n; i++) {
        if (n % i == 0) {
            factors.push_back(i);
            while (n % i == 0) n /= i;
        }
    }
    if (n > 1) factors.push_back(n);

    for (ll g = 2; g < p; g++)
        if (is_primitive_root(g, p, factors))

```

```

        return g;
    return -1;
}

```

### More

- $1^2 + \dots + n^2 = n(n+1)(2n+1)/6$
- $1^3 + \dots + n^3 = (n(n+1)/2)^2$
- $1^4 + \dots + n^4 = n(n+1)(2n+1)(3n^2+3n-1)/30$
- $1^5 + \dots + n^5 = n^2(n+1)^2(2n^2+2n-1)/12$
- $n$  is a prime  $\Leftrightarrow (n-1)! \equiv n-1 \pmod{n}$

## Geometry

### Dot Product

```

//remember that u * v = 0 -> u is perpendicular with v
//or (u, v) = pi/2
double dotProduct(Vector u, Vector v){
    return u.x * v.x + u.y * v.y;
}

```

### Angle

```

//u * v = |u| * |v| * cos(theta)
//-> theta = acos (u * v / (|u| * |v|))
double Cos(Vector u, Vector v){
    return dotProduct(u, v)/(u.len * v.len);
}

double theta(Vector u, Vector v){
    return acos(Cos(u, v));
}

```

### Cross Product

```

//u * v = |u| * |v| * sin(theta)
//u * v = u.x * v.y - u.y * v.x
//|u * v| = area of a parallelogram formed by adjacent vectors u and v
//= double the area of the triangle
double crossProduct(Vector u, Vector v){
    return u.x * v.y - u.y * v.x;
}

```

### Distance from a Point to a line

$$d(C, AB) = |\vec{AB} \times \vec{AC}|/AB$$

```

// Compute the distance from AB to C
// if isSegment is true, AB is a segment, not a line.
double linePointDist(Point A, Point B, Point C, bool isSegment){
    double res = abs(cross(A, B, C)) / dist(A, B);
    if (isSegment){
        int dot1 = dot(B, A, C);
        if (dot1 < 0) return distance(B, C);

    double a, b, c;
    Line(double a = 0, double b = 0, double c = 0) :
        a(a), b(b), c(c) {}
    Line(Point A, Point B) {
        a = B.y - A.y;
        b = A.x - B.x;
        c = a * A.x + b * A.y;
    }
};

Line Perpendicular_Bisector(Point A, Point B) {
    Point M = (A + B) / 2;
    Line d = Line(A, B);
    // the equation of a perpendicular line has the
    // form: -Bx + Ay = D
    double D = -d.b * M.x + d.a * M.y;
    return Line(-d.b, d.a, D);
}

//Intersection of 2 Perpendicular Bisector is the
//center of the circle

```

### Symmetry

```

struct Line { // Ax + By = C
    double a, b, c;
    Line(double a = 0, double b = 0, double c = 0) :
        a(a), b(b), c(c) {}
};

Point intersect(Line d1, Line d2) {
    double det = d1.a * d2.b - d2.a * d1.b;
    // det != 0 because d1 is perpendicular to d2
    return Point((d2.b * d1.c - d1.b * d2.c) / det, (
        d1.a * d2.c - d2.a * d1.c) / det);
}

Point Symmetry(Point X, Line d) {
    // the equation of a perpendicular line has the
    // form: -Bx + Ay = D

```

```

    double D = -d.b * X.x + d.a * X.y;
    Line d2 = Line(-d.b, d.a, D);
    Point Y = intersect(d, d2);
    Point X2 = Point(2 * Y.x - X.x, 2 * Y.y - X.y);
    return X2;
}

```

### Rotation

To rotate  $A(x, y)$  counterclockwise by an angle  $\theta$  around the origin, we can easily use this formula:

$$x' = x \cos \theta - y \sin \theta$$

$$y' = x \sin \theta + y \cos \theta$$

```

Point Rotations(Point A, Point C, double rad) {
    Point A2 = A - C;
    Point B2 = Point(A2.x * cos(rad) - A2.y * sin(rad),
        A2.x * sin(rad) + A2.y * cos(rad));
    Point B = B2 + C;
    return B;
}

```

### Area of a Polygon

```

double polygonArea(const vector<Point>& poly) {
    int n = poly.size();
    double area = 0.0;
    for (int i = 0; i < n; i++) {
        int j = (i + 1) % n;
        area += poly[i].x * poly[j].y - poly[j].x *
            poly[i].y;
    }
    return fabs(area) / 2.0;
}

```

### Relative position of a point to a polygon $O(N)$

```

//using Area
//Time Complexity: O(N) per query
PointPolygonPosition position(Polygon plg, Point p) {
    long long sSumTris = 0;
    for (int i = 0; i < plg.nVertices; i++) {

### More

- Number of triangles with no polygon side (no two vertices adjacent):  $n(n-4)(n-5)/6$ .
- Number of intersection points of diagonals in a convex n-gon:  $n(n-1)(n-2)(n-3)/24$
- Number of triangles formed by one diagonal + a third vertex:  $\binom{n}{2}(n-4)$
- Partitions of the polygon into triangles using non-crossing diagonals:  $C_{n-2} = \frac{1}{n-1} \binom{n-4}{n-2}$  where  $C_k$  is the  $k$ -th Catalan number.
- Number of ways to choose a set of non-crossing diagonals  $C_{n-2}$
- Number of ways to choose  $k$  non-crossing diagonals in a convex =  $N(n, k) = \frac{1}{k+1} \binom{n-3k}{k}$ .
- You are given a convex polygon with  $n$  sides. You then connect all of the points by drawing lines among the diagonals of the polygon, then cut through the lines all at once. The maximum number of pieces:  $R(N) = (n-1)(n-2)(n^2 - 3n + 12)/24$
- With a circle:  $+ = n$  ( $n$  edges).
- $a/\sin A = b/\sin B = c/\sin C = R$

- Menelaus: a line that cross BC, AC, AB at points D, E, F  $\rightarrow AF/FB \cdot BD/DC \cdot CE/EA = 1$
- Ceva: AX, BY, CZ will be concurrent, if:  $BX/XC \cdot CY/YA \cdot AZ/ZB = 1$
- Apollonius: Median line AD:  $AB^2 + AC^2 = 2(AD^2 + BC^2/4)$
- Euler:  $OI^2 = R(R - 2r)$
- Cyclic quadrilateral:  $\angle A + \angle C = 180^\circ$ ,  $AB \cdot CD = AD \cdot BC$ ,  $AC \cdot BD = AB \cdot CD + AD \cdot BC$
- Simson line: the feet of the perpendiculars from a point on a triangle's circumcircle to the sides of the triangle are collinear.
- Triangle:  $S = \sqrt{p(p-a)(p-b)(p-c)}$
- Cyclic quadrilateral:
- $S = \sqrt{(p-a)(p-b)(p-c)(p-d)}$

## Algebra

### Matrix Multiplication

Example:

$$\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} \begin{bmatrix} 5 & 6 \\ 7 & 8 \end{bmatrix} = \begin{bmatrix} 1 \cdot 5 + 2 \cdot 7 & 1 \cdot 6 + 2 \cdot 8 \\ 3 \cdot 5 + 4 \cdot 7 & 3 \cdot 6 + 4 \cdot 8 \end{bmatrix} = \begin{bmatrix} 19 & 22 \\ 43 & 50 \end{bmatrix}$$

```
#define vi vector<int>
struct Matrix{
    vector<vi> a;
    int r, c;
    Matrix(){
        a.clear(); r = c = 0;
    }
    Matrix(vector<vi> a, int r, int c): a(a), r(r), c(c) {}
    Matrix operator * (const Matrix &B) const{
        vector<vi> res(r, vi(B.c, 0));
        vector<vi> b = B.a;

        rep(i, r){
            rep(j, B.c){
                rep(k, c){
                    res[i][j] += a[i][k] * b[k][j] % MOD;
                    res[i][j] %= MOD;
                }
            }
        }

        return Matrix(res, r, B.c);
    }
};

Matrix Pow(Matrix A, int b){
    vector<vi> a(A.r, vi(A.c, 0));
    rep(i, A.r) a[i][i] = 1;

    Matrix res(a, A.r, A.c);
```

```
while (b){
    if (b & 1) res = res * A;
    A = A * A;
    b >>= 1;
}

return res;
}
```

### Fast Fourier Transform

```
namespace FFT{

        ntt(fa, 1);
    }
}

```

## Combinatoric

### Formula

```

//DP version:
void preCompute(){
    for (int i = 0; i <= n; i++){
        C[i][0] = 1;
        for (int k = 1; k <= i; k++){
            C[i][k] = C[i - 1][k - 1] + C[i - 1][k];
        }
    }
}

//"you know what it is" version:
int C(int n, int k){
    if (n < k || k < 0) return 0;
    return mul(fact[n], mul(ifact[n - k], ifact[k]))
}

```

## Catalan

$$C_n = \sum_{k=0}^{n-1} C_k C_{n-1-k} = \frac{1}{n+1} \binom{2n}{n}$$

## Applications

- Number of ways to triangulate a convex polygon with  $n + 2$  vertices.
- Number of Dyck words of length  $2n$  (strings of  $n$  X and  $n$  Y, every prefix has  $\#X \geq \#Y$ ).
- Number of valid parentheses sequences with  $n$  pairs.

For  $n = 3$ :  $((()))$ ,  $((()()))$ ,  $((())())$ ,  $(()())()$ ,  $(())()()$ .

- Number of ways to parenthesize  $(n + 1)$  factors.

Example ( $n = 3$ ):

$((ab)c)d$ ,  $(a(bc))d$ ,  $(ab)(cd)$ ,  $a((bc)d)$ ,  $a(b(cd))$

- Number of full binary trees with  $n$  internal nodes.

## Derangement

```

//Principle of Inclusion-Exclusion
int c = 1;
for (int i = 1; i <= n; i++) {
    c = (c * i) + (i % 2 == 1 ? -1 : 1);
    cout << c << ' ';
}

//DP
//dp[n] = (n - 1)(dp[n - 2] + dp[n - 1])

```

## Classical Sums

$$\sum_{k=0}^n \binom{n}{k} = 2^n$$

$$\sum_{k=0}^n k \binom{n}{k} = n \cdot 2^{n-1}, \quad \sum_{k=0}^n k^2 \binom{n}{k} = n(n+1) \cdot 2^{n-2}$$

$$\sum_{k=0}^n (-1)^k \binom{n}{k} = 0 \quad (n > 0)$$

$$\sum_{k=0}^n \binom{n}{k}^2 = \binom{2n}{n}$$

$$\sum_{k=0}^r \binom{m}{k} \binom{n}{r-k} = \binom{m+n}{r} \quad (\text{Vandermonde})$$

## Useful Identities

$$\sum_{k=r}^n \binom{k}{r} = \binom{n+1}{r+1} \quad (\text{Hockey-stick})$$

$$\sum_{k=0}^r (-1)^k \binom{r}{k} \binom{n+k}{m} = \binom{n}{m-r}$$

$$\binom{n}{k_1, k_2, \dots, k_m} = \frac{n!}{k_1! k_2! \dots k_m!}, \quad \sum k_i = n$$

## Stirling Numbers

$$S(n, k) = S(n-1, k-1) + kS(n-1, k)$$

$$x^n = \sum_{k=0}^n S(n, k)(x)_k, \quad (x)_k = x(x-1) \dots (x-k+1)$$

## Lucas Theorem

if  $p$  is a prime number,  $n = n_t p^t + n_{t-1} p^{t-1} + \dots + n_0$  and  $k = k_t p^t + k_{t-1} p^{t-1} + \dots + k_0$ , then  $\binom{n}{k} \equiv \prod_{i=0}^t \binom{n_i}{k_i} \pmod{p}$

```
vector<int> getRepresentation(int N) {
    vector<int> res;
    while (N > 0) {
        res.push_back(N % M);
        N /= M;
    }
    return res;
}
```

```
vector<int> n = getRepresentation(N);
vector<int> k = getRepresentation(K);
long long res = 1;
for (int i = 0; i < k.size(); ++i) {
    res = (res * C(n[i], k[i])) % M;
}
```

## Game Theory

### P and N set

N and P have to satisfy:

- set P must contain all final states
- for each state  $s$  in N, there exists at least 1  $s'$  reachable from  $s$  that belongs to P
- for each state  $s$  in P, all states  $s'$  reachable from  $s$  must belong to N

```
bool isInP(State u) {
    //T = end state
    if (u in T) return true;

    //S = states
    for (State v in S)
        if (u, v) in Q and isInP(v)
            return false;

    return true;
}

//example in Nim-3:
bool isInP(int u) {
    if (dp[u] != -1) return dp[u];
    if (u == 0) return dp[u] = 1;

    for (int v = u - 1; v >= max(u - 3, 0); v--)
        if (isInP(v)) {
            return dp[u] = 0;
        }

    return dp[u] = 1;
}

if (!isInP(n)) cout << "A win";
else cout << "B win";
```

### NIM

if  $p_1 \text{ xor } p_2 \text{ xor } \dots \text{ xor } p_n = 0$ , then  $B$  will win, else,  $A$  will win.

```
bool isInP(vector<int> v) {
    int g = 0;
    for (auto p: v) g ^= p;
    return (g == 0);
}
```

### Sprague-Grundy

- Grundy function:  $g(x) = \text{mex}(\{g[y] : (x, y) \in Q\})$
- B win if  $g(n) = 0$

```
int mex(vector<int>& U) {
    int res = 0;
    sort(U.begin(), U.end());
    for (int x: U)
        if (res == x)
            ++res;
    return res;
}
```

```
int g(state x){
    vector<int> U;
    for (state y: g[x]){
        U.push_back(g(y))
    }
    return mex(U);
}
```

## Others

### Test?

```
ll rand(ll l, ll r){
    return rd() % (r - l + 1) + l;
}

int w[N];

main()
{
    // freopen(name".inp","r",stdin); freopen(name".
    out","w",stdout);w
    srand(time(0));
    int c = 0;
    ios_base::sync_with_stdio(false); cin.tie(0);
    cout.tie(0);
    for (int i = 1; i<=1000; i++){
        ofstream fo("a.inp");
        int n = 1000;
        fo<<n<<endl;
        REP(i, n) fo<<rand(1, 100000000)<<endl;
        REP(i, n) fo<<rand(1, 100000000)<<endl;
        system("ac.exe");
        system("trau.exe");
        if (system("fc a1.out a2.out") == 1) exit(0);
    }
    return 0;
}
```

## Big Int

## CODE::BLOCK Set Up

\*

Settings -> Compiler... -> Selected compiler:  
GNU GCC Compiler

Have g++ follow the C++17 ISO C++ language standard [-std=c++17]

Enable all common compiler warnings (-Wall)

Enable extra compiler warnings (-Wextra)

-O2

## Template

Settings -> Editor -> Abbreviations -> Add

Ctrl + J to use

## CODE::BLOCK shortcuts

\*

- Ctrl + Space → Autocomplete (symbols, functions, variables).
- Ctrl + Shift + C → Comment selected block.
- Ctrl + Shift + X → Uncomment selected block.
- Ctrl + D → Duplicate current line/selection.
- Ctrl + Shift + ↑ / ↓ → Move current line/selection up or down.
- Ctrl + L → Delete current line.
- Ctrl + Shift + K → Insert new line above current line.
- Ctrl + Shift + J → Insert new line below current line.
- Ctrl + G → Go to line.
- Ctrl + Shift + V → Paste without indentation (useful when pasting code from outside).

## Multiplication Function

```
ll mult(ll x, ll y, ll md) {
    ull q = (ld)x * y / md;
    ll res = ((ull)x * y - q * md);
    if (res >= md) res -= md;
    if (res < 0) res += md;
    return res;
}
```

## Random Function

```
mt19937_64 rng(chrono::steady_clock::now().
    time_since_epoch().count());
long long get_rand(long long r) {
    return uniform_int_distribution<long long>(0, r -
        1)(rng);
}
```
